This resource guides prescribers, pharmacists, and regulators with an update on the recent expansion of basic and clinical knowledge that forms a framework for understanding cutaneous reactions. This understanding will lead, in turn, to better outcomes and decisions in treatment and management, both in the clinic and in the life cycle of drug development. The skin is a common target for adverse drug events and even mild rashes can be part of life-threatening syndromes. Patients and practitioners often face important decisions about therapy after a drug eruption, including treatment, cross-reactivity with future pharmaceuticals, genetic considerations and dealing with long-term sequelae after a reaction. An international team of experts and leaders in the field share their story and insights into the scientific details and relevant clinical context.

Erectile dysfunction can affect all age groups. Numerous physical and emotional risk factors may contribute to the problem. These risk factors can range from chronic diseases and medications to psychological factors. In the U.S. alone, it has been estimated that 18 to 30 million men suffer from erectile dysfunction. This number has increased significantly as awareness of the disorder has heightened.
