Mouse Development - 1st Edition

Abstract. The mammalian preimplantation embryo is a highly tractable, self-organizing developmental system in which three cell types are consistently specified without the need for maternal factors or external signals. Studies in the mouse over the past decades have greatly improved our understanding of the cues that trigger symmetry breaking in the embryo, the transcription factors that control lineage specification and commitment, and the mechanical forces that drive morphogenesis and ...

The morphologic data, together with an analysis of changes in the molecular patterning of Fgf3 mutant otic vesicles, and comparisons with other mutations affecting otic morphogenesis, allow placement of Fgf3 between hindbrain-expressed Hoxa1 and Mafb (Kr) and otic vesicle-expressed Gbx2 in the genetic cascade initiated by WNT signaling that leads to dorsal otic patterning and endolymphatic duct formation.

Abstract. During vertebrate development, brain patterning and head morphogenesis are tightly coordinated. In this paper, we study these processes in the mouse mutant Fused toes ( Ft ), which presents severe head defects at midgestation. The Ft line carries a 1.6-Mb deletion on chromosome 8.
