Ndiff is a tool to aid in the comparison of Nmap scans. It takes two Nmap XML output files and prints the differences between them. The differences observed are: Host states (e.g. up to down)

Chapter 16. Ndiff Reference Guide | Nmap Network Scanning
Nmap Cheat Sheet. Reference guide for scanning networks with Nmap. Table of Contents. What is Nmap? How to Use Nmap. Command Line; Basic Scanning Techniques. Scan a Single Target; Scan Multiple Targets; Scan a List of Targets; Scan a Range of Hosts; Scan an Entire Subnet; Scan Random Hosts; Exclude Targets From a Scan; Exclude Targets Using a List; Perform an Aggressive Scan

GitHub - jasonmiebauer/Nmap-Cheatsheet: Reference guide ...
To get started. This is a simple command for scanning your local network (class C or /24): nmap -sV -p 1-65535 192.168.1.1/24. This command will scan all of your local IP range (assuming your in the 192.168.1.0-254 range), and will perform service identification -sV and will scan all ports -p 1-65535.

Nmap Tutorial: from the Basics to Advanced Tips
On average Nmap sends 5-10 fewer packets per host, depending on network conditions. If a single subnet is being scanned (i.e. 192.168.0.0/24) Nmap may only have to send two packets to most hosts.-n (no DNS resolution) Tells Nmap to never do reverse DNS resolution on the active IP addresses it finds. Since DNS can be slow even with Nmap's built-in parallel stub resolver, this option can slash scanning times.

Databases, Systems & Networks - Nmap Reference Guide
Reading the nmap reference guide, I can see why I made this assumption:-sn (No port scan) This option tells Nmap not to do a port scan after host discovery, and only print out the available hosts that responded to the host discovery probes.
