Non Carious Cervical Lesions

Non-carious cervical lesions (NCCL) are defined as dental tissue lost at or near the cementoenamel junction (CEJ), and not relating to tooth decay. NCCLs are common in the dentitions of recent human populations. They may result from several processes including abrasion, acid erosion and abfraction.

Non-carious cervical lesions - Wikipedia

Noncarious cervical lesions (NCCL) involve the loss of hard tissue from the cervical areas of teeth through processes unrelated to caries. NCCLs are nowadays a common pathology caused by changes in lifestyle and diet. The prevalence and severity of cervical wear increase with age. It is generally accepted that the lesions are not generated by a single factor but result from a combination of factors.

Treatment of noncarious cervical lesions: when, why, and how

The etiology of non-carious cervical lesions (NCCL) is a combined, or more commonly, a multifactorial condition. There are three mechanisms that contribute to the etiology of NCCLs: stress, friction, and bio-corrosion. The effects of stress manifested as abfraction and occurs through the dynamics of both static and cyclic occlusal loading.

Non-Cariou Cervical Lesions | Inside Dentistry

In an initial clinical examination, 140 cases were selected that presented one or more teeth with non carious cervical wear. For each case, a similar sex and age control without any tooth with non carious cervical lesions was selected. An occlusal examination and periodontal probing were performed in all cases and controls by skilled dentists.

Non carious cervical lesions and risk factors: A case ...

Non-carious cervical lesions (NCCL) are characterized by a loss of hard dental tissue near the cement-enamel-junction. Commonly, their shape is like a wedge with the apex pointing inwards. Other times, they appear as regular depressions, like a dome or a cup. Their main characteristic is the presence of hard-mineralized tissue.

Non carious cervical lesions. A review

Non-carious cervical lesions (NCCL) are characterized by a loss of hard dental tissue near the cement-enamel-junction. Commonly, their shape is like a wedge with the apex pointing inwards. Other...

(PDF) Non carious cervical lesions. A review

estimated, role in the etiology of non-carious cervical lesions. The very nature of non-carious cervical lesions makes them difficult to study, because what causes the lesions to initially form may or may not be what results in their progression. By the time the lesion is formed, the "smoking gun" may be long gone. As most research reveals, the etiology and progression of non-carious cervical lesions

Handout Non-Cariou Cervical Lesions: Causes ...

A noncarious cervical lesion (NCCL) is a small saucer- or notch-shaped loss of tooth structure at the cementoenamel junction that is most commonly found on the tooth ' s facial surface (Figure 1). These lesions are not at increased risk of caries because they are generally accessible for self and professional cleaning.

Treatment Strategies for Noncarious Cervical Lesions ...

- Currently it is accepted that non-carious cervical lesion have a multifactorial etiology and are not related to any one factor. A combination of erosion, abrasion and abfraction may operate in the initiation and progression of these lesions. 9.

Non carious cervical lesion - SlideShare

Non-carious cervical lesions (NCCL), defined as loss of dental tissue in absence of bacterial aggression, have a multifactorial etiology, implying abrasion, abfraction and acid erosion, acting ...

(PDF) Treatment of non-carious lesions: Diagnosis ...

Clinical presentation of abfraction non-carious tooth tissue lesions on the cervical margins of upper left canine and premolar Abfraction is a theoretical concept explaining a loss of tooth structure not caused by tooth decay (non-carious cervical lesions).

Abfraction - Wikipedia

At this time, restoration of noncarious cervical lesions (NCCLs) is a common occurrence in clinics nowadays. Some reasons for this are the growth of the elderly population, a smaller rate of tooth loss, and possibly the increase of some etiologic factors.

Restoration of Noncarious Cervical Lesions: When, Why, and How

Noncarious cervical lesions (NCCL) are defined as a loss of hard dental tissue near the cementoensamel junction, usually on the buccal surfaces of teeth, resulting in a grooved or wedge-shaped area of missing tooth structure.

Managing Noncarious Cervical Lesions - Decisions in Dentistry

Erosion and abrasion have been widely reported as causes of non carious cervical lesions (NCCL). However, more recently, tooth flexure has been implicated in the formation of these lesions generating renewed interest in the pathogenesis of the non carious loss of cervical tooth substance.

The aetiology of the non carious cervical lesion - Osborne ...

The term noncarious cervical lesion (NCCL) refers to the loss of tooth structure at the cementoensamel junction - (CEJ) and subjacent root surface of the teeth by wear processes unrelated to bacterial action. The lesions can be located on the vestibular, oral, or approximal side of the tooth.
