The chloride resistance depends on the permeability of the concrete and the thickness of cover to the reinforcement. The integrity of the concrete cover under service load, in terms of cracking and crack width, also influences the resistance to penetrating chlorides. Corrosion of steel reinforcement is an electrochemical process.

(PDF) **Resistance of Concrete to Chloride Ingress—Testing**

The resistance of concrete to chlorides was evaluated by the modified diffusion test in accordance with reference, which is a modified version of Chinese standard JTJ270-98 (Chemical analysis). Powder was collected from the specimens at the different depths by the means of drilling and passed the 0.15 mm sieve.

Resistance of concrete against combined attack of chloride

In regions where the concrete structures are exposed to a salty environment, the concrete requires high resistance to chloride-ion penetration. To achieve higher resistance against chloride ingress, a pozzolanic admixture incorporating a high volume of SiO 2 and Al 2 O 3 has been developed.

resistance of concrete to chloride ingress testing and

It is intended for use in determining the effects of variations in the properties of concrete on the resistance of the concrete to chloride ion penetration. Variations in the concrete may include, but are not limited to, changes in the cement type and content, water/cement ratio, aggregate type and proportions, admixtures, treatments, curing, and consolidation.

This report discusses the various factors affecting chloride resistance of concrete, mechanisms of chloride transport, related test methods and performance specifications. It also assesses additional measures to enhance the chloride resistance of concrete. Cement Concrete & Aggregates Australia, International Partner Access

Chloride resistance of concrete

With regards to corrosion resistance, the specifier indicates the method of curing and duration of aging of test specimens and the maximum charge allowed using ASTM C1202 (AASHTO T 277), Standard Test Method for Electrical Indication of Concrete's Ability to Resist Chloride Ion Penetration. The resistance to chloride ion penetration is used, because, as mentioned earlier, chloride ingress is the most common cause of reinforcing steel corrosion.

Corrosion Resistance of Concrete

Corrosion of steel reinforcement in concrete is the most common problem affecting the durability of reinforced concrete structures. Chloride-induced corrosion is one of the main mechanisms of deterioration affecting the long-term performance of suc

Chloride Resistance Of Concrete—CGAA

When it comes to chloride transport, there was only marginal variation in the diffusivity of chloride ions. The corrosion resistance of CAC mixture was significantly enhanced: its chloride threshold level for corrosion initiation exceeded 3.0% by weight of binder, whilst OPC and CAC concrete indicated about 0.5%–1.0%.

Corrosion Resistance of Calcium-Aluminate Cement Concrete

The resistance of concrete containing by-products materials to the combined influence of carbonation and chloride ingress has been studied. The fly ash (FA) and silica fume (SF) as by-products materials were used with ordinary Portland cement (OPC) in ternary cementitious system. Group of concrete mixes with water/cementitious blends materials ratio of 0.4 and have the same degree of workability and air content were investigated.

Resistance of concrete containing ternary cementitious

Chloride-induced corrosion of steel rebar embedded in concrete is one of the major concerns influencing the durability of reinforced concrete structures. It is widely recognized that the carbonation in concrete affects the chloride diffusivity and accelerates the chloride-induced reinforcement corrosion.
